

Assembling Folding Space-Station Interior "N"

Cool Interior #1

Unlike most of my previous folding sci-fi interiors, this one doesn't have a theme. There aren't any special fittings or machinery. It's just an interesting floor plan, a "leftover" from a doodling session that never got matched up with a theme, but which is just too neat to consign to oblivion. Think of it as storage space, or "under construction," or abandoned due to failing environmental controls. Or add fittings from other modules to make it what you want.

This particular plan consists of a four-way crossing of narrow halls, and four fair-sized rooms, each with one or two little alcoves in the corners. None of the rooms are connected; you have to use the halls to get from one to another. Good for storage, or for ambushes.

Print one copy of each page. Assembly of the main walls is similar to interior #5 (the cryogenics lab). Cut the slots in the bottoms of the long walls before gluing them together; avoid getting glue near these slots. Glue the tabs on the raised floor section (from wall page #1) into the slots, then affix this floor section onto the main floor. Be careful that the top slots in the long walls (for holding the crosswise walls) line up with each other, because I didn't make sure while building my prototype and had to cut a new slot. The other walls go together in the usual fashion.

It all looks like this when done:

```
#####  
#   | |   #  
#  -|+|-  #  
#   | |   #  
#   + |   #  
#-|--|+|+|-#    "+" are doors
```

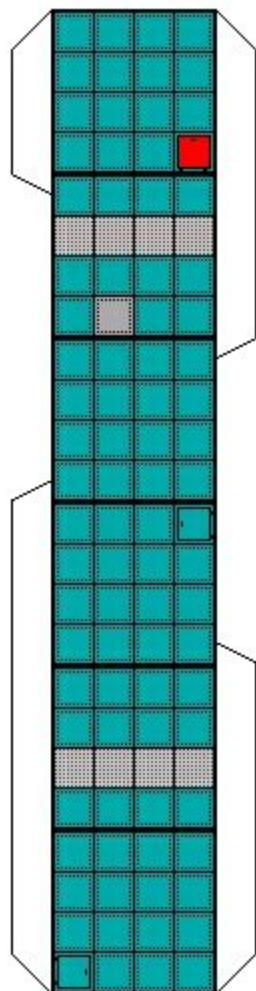

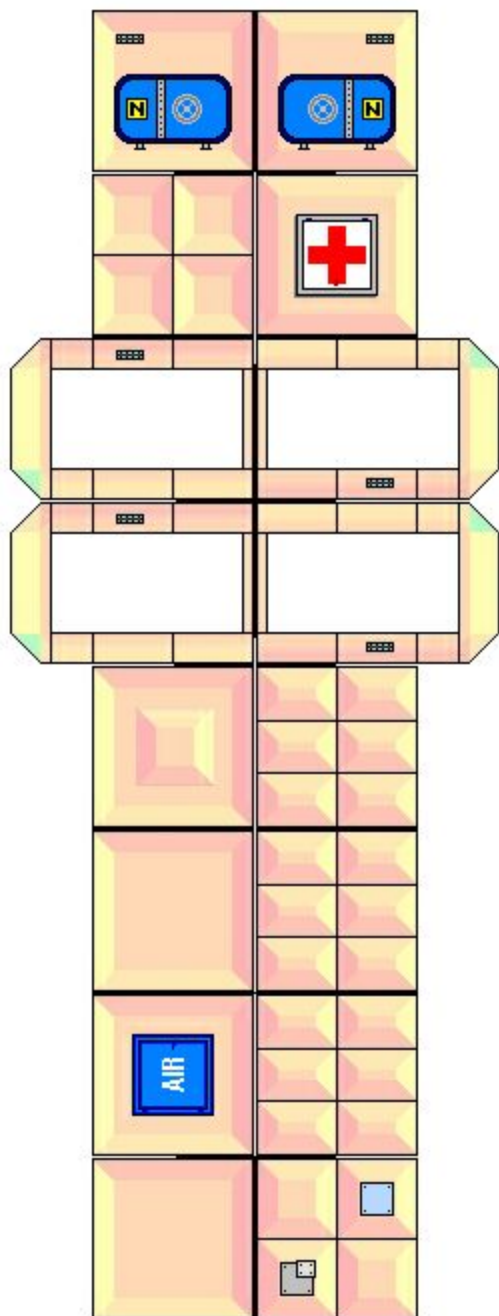

```
# + + + + #
#-|+|+|+|-#
#   | +   #
#   | |   #
#  -|+|-  #
#   | |   #
#####
```

Make sure the doors in the outer walls line up with the narrow corridors;
set
them in place and get them in the right order before you glue. These outer
walls are also good for my other interiors that ask for few doors.
